CLEVELAND - Thin-gauge thermoformer Amros Industries Inc. of Cleveland now is making its real-time production control software available commercially to injection molders and thermoformers.

President Greg Shteyngarts said Amros has been using the program in its plant for more than two years, during which time productivity increased 28 percent.

The software allows companies to manage and schedule customers' orders and monitor productivity, sorting production orders based on priority.

The software even calculates the financial impact of a project, analyzing the company's ability to cover the costs. In order to keep actual dollar figures secure, the software quantifies as a percentage whether the firm is below or above its break-even point.
